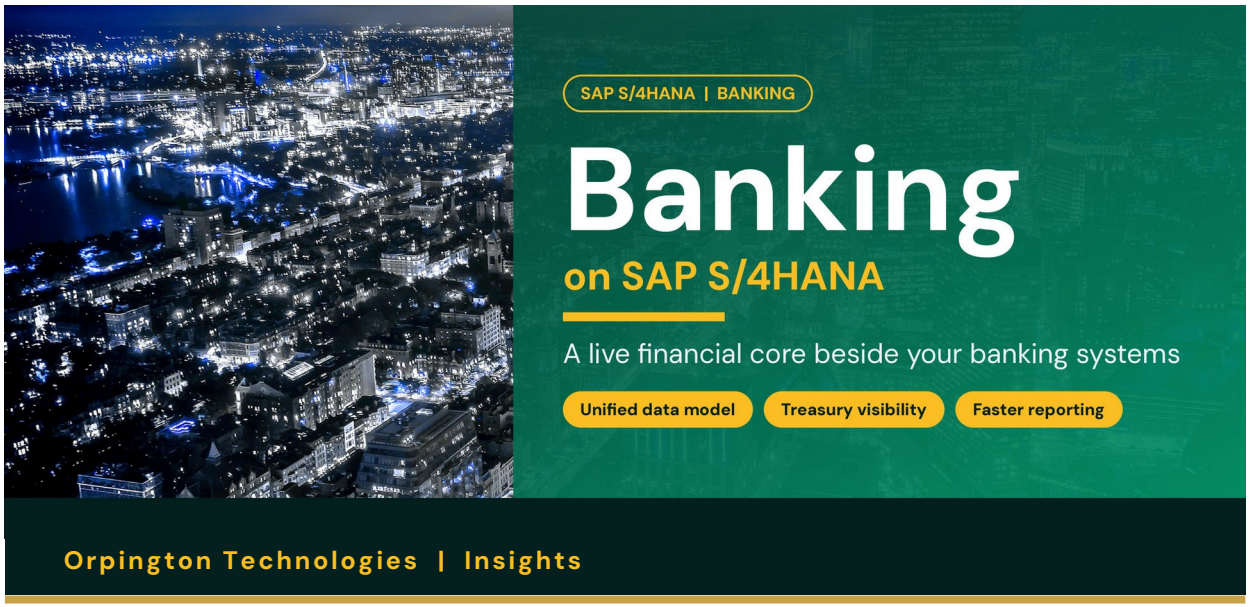
SAP S/4HANA INSIGHTS

SAP S/4HANA for Banking: Benefits and Use Cases

A bank's finance team spends its days matching what the product systems say with what the ledger says. SAP S/4HANA gives you a live finance core to match them in, so the answers arrive sooner.



In short: For banks, SAP S/4HANA is the finance core, and SAP's banking and insurance partner SAP Fioneer builds industry solutions on top of it. The financial products subledger converts business transactions into journal entries and posts them to the S/4HANA general ledger [1]. Transactional Banking for SAP S/4HANA is an open core banking platform [2]. The Bank Management Edition adds automated reconciliation between operations and finance [3]. The sources give no savings figures, so the size of the gain depends on your own landscape.

Think about the last day of a reporting period in a bank. The product systems hold the loans, the deposits and the cards. The ledger holds the accounting. Between them sits a layer of interfaces and reconciliations, and a team that checks that the two agree. If they do not, someone finds out why, usually under time pressure.

That layer is where S/4HANA tries to help. SAP says S/4HANA blends transactions and analytics, so operational reports can run on live transactional data [4]. The Universal Journal holds financial accounting and controlling data together, and SAP says no reconciliation between them is necessary [5]. In a bank, that removes one reconciliation, and the subledger and the bank management solutions address others.

Orpington Technologies, an ERP advisory firm, starts banking conversations with one question. How many reconciliations stand between a customer transaction and a number in your regulatory report? The answer tells you where the effort goes today.

Key takeaways: SAP S/4HANA for banking

Subledger. The financial products subledger centralizes accounting data and rules for financial instruments and posts journal entries to the S/4HANA general ledger [1].

© Orpington Technologies Inc.

Core banking. Transactional Banking covers deposits, savings, loans, collateral and virtual accounts, with add-ons for cards, payments and account origination [2].

Bank management. The Bank Management Edition adds liquidity management, financial control for closing and reporting, and an ESG KPI engine [3].

One ledger. The Universal Journal keeps finance and controlling on one set of line items [5].

Partner solutions. The banking-specific solutions come from SAP Fioneer, and SAP lists them as partner solutions.

The condition. A live finance core needs clean product, customer and accounting data.

1. Why banking is a good fit for SAP S/4HANA

Banks are data businesses with heavy rules. Every product carries accounting treatment, every transaction needs a journal entry, and regulators ask for several views of the same numbers. SAP's partner page describes the need clearly. It says banks and insurers face complex regulatory and reporting requirements, and a subledger centralizes the accounting data and rules for financial instruments [1].

KPMG describes the migration work that follows from this. Its page lists S/4 Finance, the financial products subledger as the successor to SAP Advanced Financial Closing, and reporting tools such as SAP Analytics Cloud and SAP Group Reporting [6]. It names the benefits as automating existing processes, flexible reporting, better data quality and less complexity and redundancy in fragmented system landscapes, and it gives no figures [6].

One point is easy to miss. In banking, S/4HANA is rarely the whole answer. It is the finance core, and industry solutions sit beside and above it. Knowing which is which keeps the budget honest.

2. How SAP S/4HANA helps banks

A subledger between the product systems and the ledger

The financial products subledger is the clearest example. SAP describes it as a central hub for managing data between operational and finance systems. It produces multiple reconciled valuations, supports multiple currencies and handles multi-GAAP and FX accounting. It converts business transactions into journal entries and posts them to the S/4HANA general ledger [1]. Its suspense accounting handles incorrect or incomplete configuration and source data, so a bad record does not stop the posting run [1]. Users can also model future scenarios and see the effect on the balance sheet and the profit and loss statement [1].

SAP lists the benefits as consolidating data silos, relieving product systems of accounting and controlling tasks, which reduces costs, ensuring completeness of accounting, and supporting compliance with evolving regulations [1]. The page gives no measured results. SAP's page also says the solution is for banks and insurers, and that separate editions exist for each [1].

Core banking on the same platform family

Transactional Banking for SAP S/4HANA is described as an open core banking platform built for real-time processing and continuous availability. Its modules cover deposits, savings, loans, collateral and virtual accounts. Packaged add-ons include cards, payments and account origination. It supports multiple legal entities, brands, regions, currencies and languages, and it has persona-based user interfaces and product configuration in the interface [2]. SAP says it is for retail and corporate banks of all sizes and connects to other

systems through APIs [2]. Whether you need it depends on your own core banking plan, and many banks keep a separate core system.

Bank management and the finance office

SAP Fioneer's Bank Management Edition is built on S/4HANA. It offers automated reconciliation between operations and finance, analytics and controls, standardized compliance templates and an ESG KPI engine that combines ESG and finance data. It also lists liquidity management, financial control for closing and reporting, the financial products subledger, data consolidation and an integration framework, with support for multiple entities, currencies and accounting standards [3]. The benefits it names are faster decisions on current data, lower cost of compliance and less manual routine work [3]. The page gives no figures, apart from saying the company is a trusted partner of over 800 banks [3].

Cash, close and processes

SAP says S/4HANA Cloud cash management lets you view global bank balances and liquidity forecasts in real time [7]. SAP Advanced Financial Closing adds automated closing jobs and workflows, and a soft close can run several times in a period so problems show up early [8]. SAP Signavio process mining uses event logs from enterprise systems to show how processes run, including bottlenecks and variances [9]. SAP's page gives no quantified results, so the gain depends on your data [9].

A short example: one loan, three postings

For this example, a bank books a new loan in its product system. The accounting needs several things from that one event. It needs the interest income recognised under the right accounting standard, the currency effect if the loan is in a foreign currency, and a valuation for the regulatory view. The subledger holds the accounting rules and produces multiple reconciled valuations, and it supports multi-GAAP and FX accounting [1].

The result is converted into journal entries and posted to the general ledger [1]. If the loan record is missing a field, suspense accounting holds the posting and flags it, and the run goes on [1]. Without that, a single bad record can hold up a whole posting run, and the finance team learns about it at period end.

Table 1. Where SAP S/4HANA helps a bank

Question in the business	Capability	What you can see
Do product systems and ledger agree?	Financial products subledger	Business transactions turned into journal entries [1]
What is wrong with this record?	Suspense accounting	Postings completed despite incomplete source data [1]
What if the rate changes?	Scenario modelling in the subledger	Effect on balance sheet and income statement [1]
Can we run deposits and loans?	Transactional Banking	Deposits, savings, loans, collateral, virtual accounts [2]
Where is our liquidity?	Liquidity management; cash management	Balances and liquidity forecast [3], [7]
What did we earn?	Universal Journal	Finance and controlling on one set of postings [5]
Where is the delay?	SAP Signavio process mining	Actual flows, bottlenecks and variances [9]

3. SAP S/4HANA for banking: customer results and how to read them

The sources for banking are SAP's partner pages, SAP Fioneer's own pages and KPMG's consulting page. Two numbers appear. SAP Fioneer calls itself a trusted partner of over 800 banks [3], and SAP's Transactional Banking page speaks of thousands of installations worldwide [2]. Both are statements by the vendors, with no method published. KPMG gives no results at all [6]. So you have a clear list of capabilities, and you have no independent proof of savings. That is a fair description of where the evidence stands.

4. SAP S/4HANA for banking: reality check and limits

Table 2. Claims worth reading carefully

Claim	What the source says	How to read it
Lower cost	The subledger relieves product systems of accounting tasks, which reduces costs [1]	No figure is given, so build your own business case
Banking solutions	They come from SAP Fioneer and appear on SAP's site as partner solutions [1], [2]	Agree contract, support and roadmap with the partner
Customer base	Over 800 banks; thousands of installations [3], [2]	Vendor statements, with no method published
Migration benefits	Better data quality and less redundancy [6]	A consulting view, with no figures

Table 3. Questions to put to SAP, SAP Fioneer and your integrator

Topic	Question to ask	Why it matters
Scope	Which parts sit in the S/4HANA core and which in partner solutions?	The banking solutions are listed as partner solutions [1], [2]
Core banking	Do we replace our core banking system, or keep it and add a subledger?	Transactional Banking is one option, not a requirement [2]
Standards	Which accounting standards and currencies must the subledger handle?	The subledger supports multi-GAAP and FX accounting [1]
Data	Who owns the product and customer data feeding the ledger?	Suspense accounting parks what cannot be posted [1]
Reporting	Which reports stay in SAP Analytics Cloud, Group Reporting or BW?	KPMG lists several reporting tools [6]

A live system also shows bad data as fast as good data. If product, customer or accounting master data is wrong, the subledger will post it, and suspense accounting will park what it cannot handle [1]. Orpington Technologies' view is that data ownership needs as much room in the plan as the technology does.

5. SAP S/4HANA for banking: your first 90 days

Days 1 to 30: find the late numbers

List the five finance and regulatory reports that your leaders rely on most. Next to each, write how many reconciliations stand behind the number and how old it is when it arrives. Pick the

two where this costs you most, for example the liquidity report or the month-end close, and give each a business owner and a data owner.

Days 31 to 60: build one live view

Choose one view, such as the postings from one product system into the ledger. Map how the subledger would handle it [1], and agree who acts on a suspense item. Draw a line between what S/4HANA covers and what a partner solution covers.

Days 61 to 90: measure and extend

Measure the hours between period end and the signed-off figures, before and after. Retire the spreadsheet or reconciliation that the live view replaces. Then pick the next product system. Ask someone with no stake in the project to review the plan before more money is committed.

6. How Orpington Technologies supports banks on SAP S/4HANA

An independent first look. The free Implementation Confidence Diagnostic takes about 15 minutes and needs no sign-up. It gives you a confidence score with the top three risk flags [10].

Evidence-based review. The Full ERP Diagnostic Report checks every self-reported answer against real evidence, and a certified platform expert reviews the result [11].

Delivery, oversight and skills. Orpington can lead an S/4HANA migration as the accountable delivery partner, or provide independent oversight of an integrator you have already chosen [11]. It also supplies credentialed candidates through **ERP staff augmentation** [12].

For more guidance, read the **SAP S/4HANA migration and ERP insights** from Orpington Technologies.

Before your next reporting cycle, ask one thing. Which three reconciliations took the most time last quarter, and what would it take to remove one?

7. Frequently asked questions about SAP S/4HANA for banking

What are the main benefits of SAP S/4HANA for banks?

A live finance core, a financial products subledger that posts to the general ledger, bank management solutions for liquidity and closing, and one ledger for finance and controlling [1], [3], [5].

What is the financial products subledger?

It centralizes accounting data and rules for financial instruments, supports multiple valuations and currencies, and posts journal entries to the S/4HANA general ledger [1].

Does SAP S/4HANA include core banking?

SAP lists Transactional Banking for SAP S/4HANA as an open core banking platform from SAP Fioneer, with modules for deposits, savings, loans, collateral and virtual accounts [2].

What is SAP Fioneer?

It is the company behind the banking and insurance solutions that SAP lists as partner solutions for S/4HANA, including the Bank Management Edition [3], [1].

Does SAP publish savings for banks on S/4HANA?

The pages used here give no measured savings, so a bank has to build its own business case [1], [3], [6].

Do I need clean data first?

Yes. Product, customer and accounting data drive every posting, so clean them before you rely on live views.
